

THE PRESERVATION OF FAVOURED RACES IN
THE STRUGGLE FOR LIFE

BY
CHARLES DARWIN

(A Reprint of the First Edition)

WITH A FOREWORD BY
DR. C. D. DARLINGTON, F.R.S.

LONDON
WATTS & CO.
5 & 6 JOHNSON'S COURT, FLEET STREET, E.C.4

This reprint first published 1950

PUBLISHERS' NOTE

On the Origin of Species was first published on November 24th, 1859, in an edition of 1,250 copies; the second edition, with a few corrections, was published in 1860; the third, with additions and corrections, 1861; the fourth, fifth, and sixth, with additions and corrections, 1866, 1869, and 1872.

This volume is the first reprint of the First Edition, the only changes being in punctuation.

CONTENTS

FOREWORD	xi
INTRODUCTION	1
I. VARIATION UNDER DOMESTICATION	6
Causes of variability—Effects of habit—Correlation of growth—Inheritance—Character of domestic varieties—Difficulty of distinguishing between varieties and species—Origin of domestic varieties from one or more species—Domestic pigeons, their differences and origin—Principle of selection anciently followed, its effects—Methodical and unconscious selection—Unknown origin of our domestic productions—Circumstances favourable to Man's power of selection.	
II. VARIATION UNDER NATURE	38
Variability—Individual differences—Doubtful species—Wide ranging, much diffused, and common species vary most—Species of the larger genera in any country vary more than the species of the smaller genera—Many of the species of the larger genera resemble varieties in being very closely, but unequally, related to each other, and in having restricted ranges.	
III. STRUGGLE FOR EXISTENCE	52
Bears on natural selection—The term used in a wide sense—Geometrical powers of increase—Rapid increase of naturalized animals and plants—Nature of the checks to increase—Competition universal—Effects of climate—Protection from the number of individuals—Complex relations of all animals and plants throughout Nature—Struggle for life most severe between	

individuals and varieties of the same species; often severe between species of the same genus—The relation of organism to organism the most important of all relations.

IV. NATURAL SELECTION

69

Natural selection—Its power compared with Man's selection—Its power on characters of trifling importance—Its power at all ages and on both sexes—Sexual selection—On the generality of intercrosses between individuals of the same species—Circumstances favourable and unfavourable to natural selection, namely, intercrossing, isolation, number of individuals—Slow action—Extinction caused by natural selection—Divergence of character, related to the diversity of inhabitants of any small area, and to naturalization—Action of natural selection, through divergence of character and extinction, on the descendants from a common parent—Explains the grouping of all organic beings.

V. LAWS OF VARIATION

114

Effects of external conditions—Use and disuse, combined with natural selection; organs of flight and of vision—Acclimatization—Correlation of growth—Compensation and economy of growth—False correlations—Multiple, rudimentary, and lowly organized structures variable—Parts developed in an unusual manner are highly variable: specific characters more variable than generic: secondary sexual characters variable—Species of the same genus vary in an analogous manner—Reversions to long-lost characters—Summary.

VI. DIFFICULTIES ON THEORY

147

Difficulties on the theory of descent with modification—Transitions—Absence or rarity of transitional varieties—Transitions in habits of life—Diversified habits in the same species—Species with habits widely different from those of their allies—Organs of extreme perfec-

tion—Means of transition—Cases of difficulty—*Natura non facit saltum*—Organs of small importance—Organs not in all cases absolutely perfect—The law of unity of type and of the conditions of existence embraced by the theory of natural selection.

VII. INSTINCT

178

Instincts comparable with habits, but different in their origin—Instincts graduated—Aphides and ants—Instincts variable—Domestic instincts, their origin—Natural instincts of the cuckoo, ostrich, and parasitic bees—Slave-making ants—Hive-bee, its cell-making instinct—Difficulties on the theory of the natural selection of instincts—Neuter or sterile insects—Summary.

VIII. HYBRIDISM

210

Distinction between the sterility of first crosses and of hybrids—Sterility various in degree, not universal, affected by close interbreeding, removed by domestication—Laws governing the sterility of hybrids—Sterility not a special endowment, but incidental on other differences—Causes of the sterility of first crosses and of hybrids—Parallelism between the effects of changed conditions of life and crossing—Fertility of varieties when crossed and of their mongrel offspring not universal—Hybrids and mongrels compared independently of their fertility—Summary.

IX. ON THE IMPERFECTION OF THE GEOLOGICAL RECORD

238

On the absence of intermediate varieties at the present day—On the nature of extinct intermediate varieties; on their number—On the vast lapse of time, as inferred from the rate of deposition and of denudation—On the poorness of our palæontological collections—On the intermixture of geological formations—On the absence of intermediate varieties in any one formation—On the sudden appearance of groups of species—On their sudden appearance in the lowest known fossiliferous strata.
